Peer Instruction: a hands-on workshop using clickers

Get your clickers ready!

- no ON/OFF button
- only last "click" counts
- display shows recorded answer

www.TurningTechnologies.com

Quick survey...

Peer Instruction...

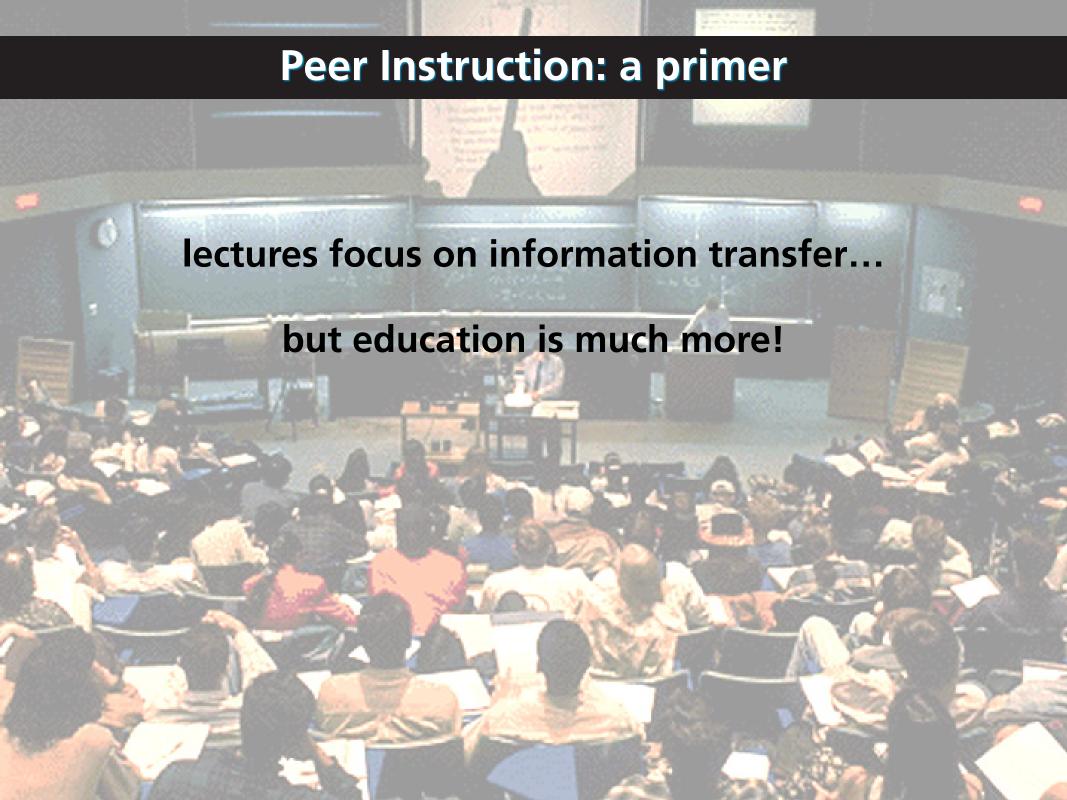

- 1. Never heard of it.
- 2. Heard of it, but don't really know what it is.
- 3. Quite familiar with it.
- 4. I heard you speak about it so often, I could give your talk

Quick survey...

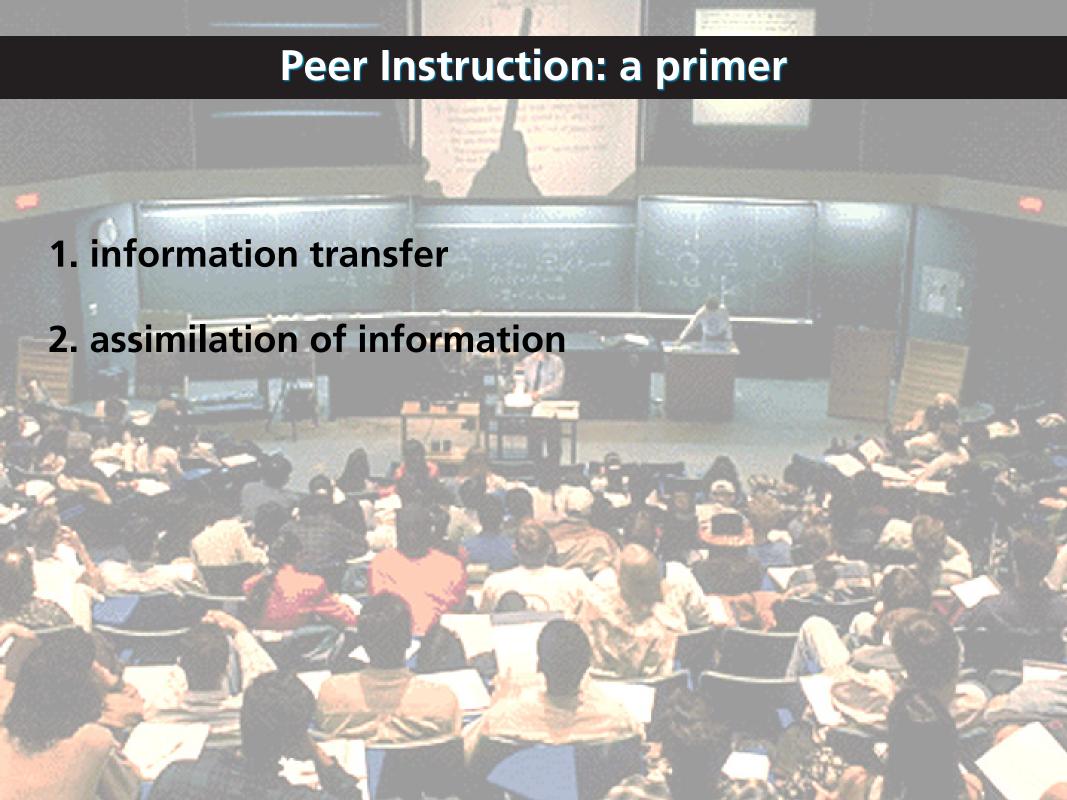

Peer Instruction...

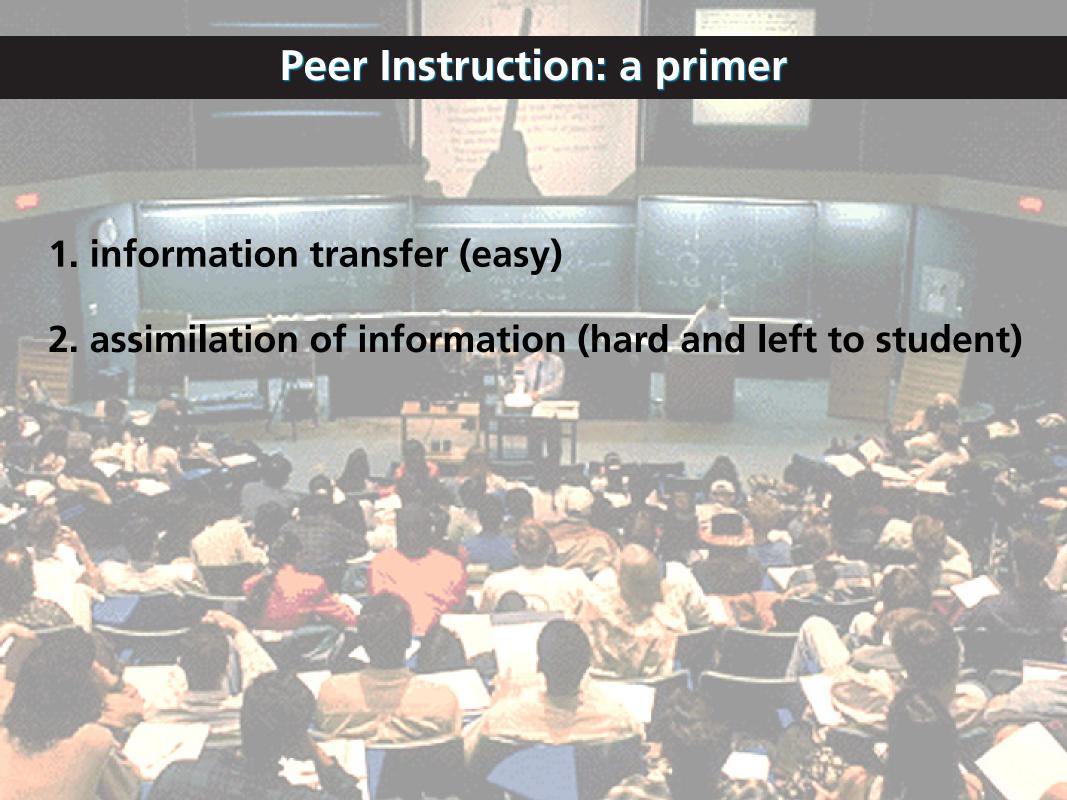

- 1. Never heard of it.
- 2. Don't use it in my classes, but I'm open to it.
- 3. Considering using it in my classes.
- 4. I have used it it in my classes a few times only.
- 5. I use it regularly in my classes.

Peer Instruction: a primer lectures focus on information transfer...

Peer Instruction: a primer 1. information transfer

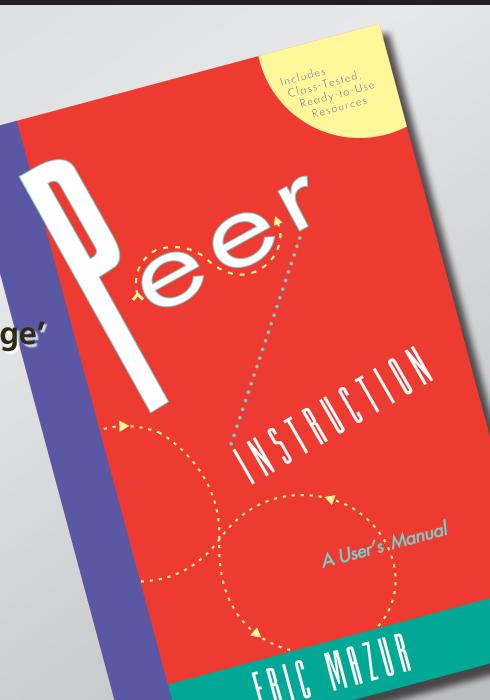

Solution: move information transfer out of classroom!

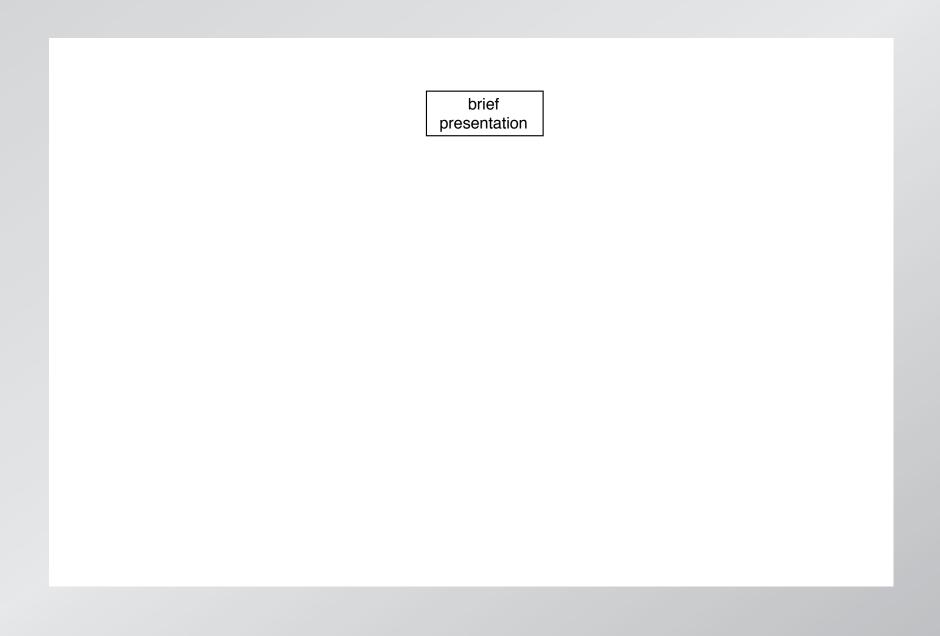

Main features:

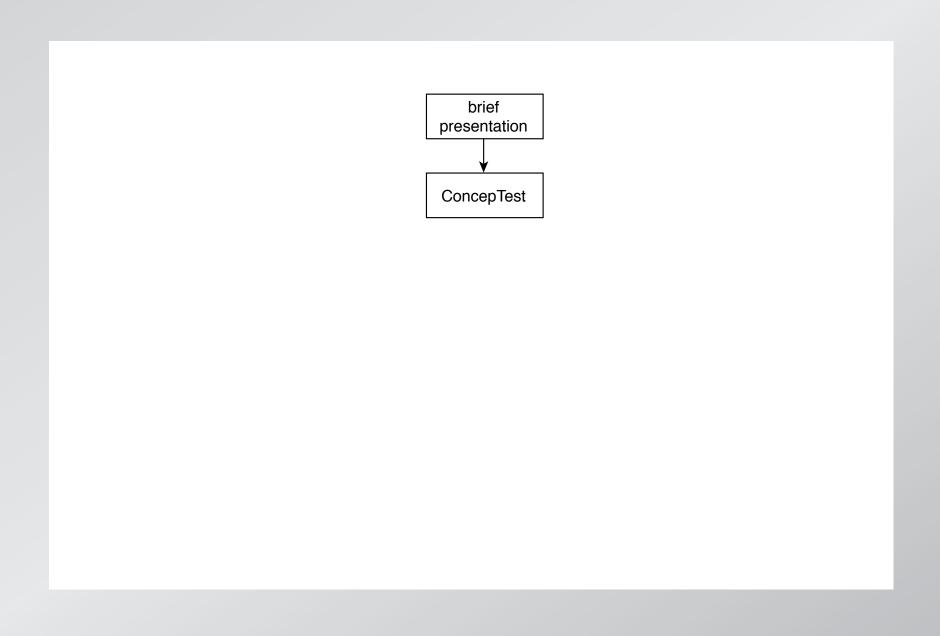

pre-class reading

in-class: depth, not 'coverage'

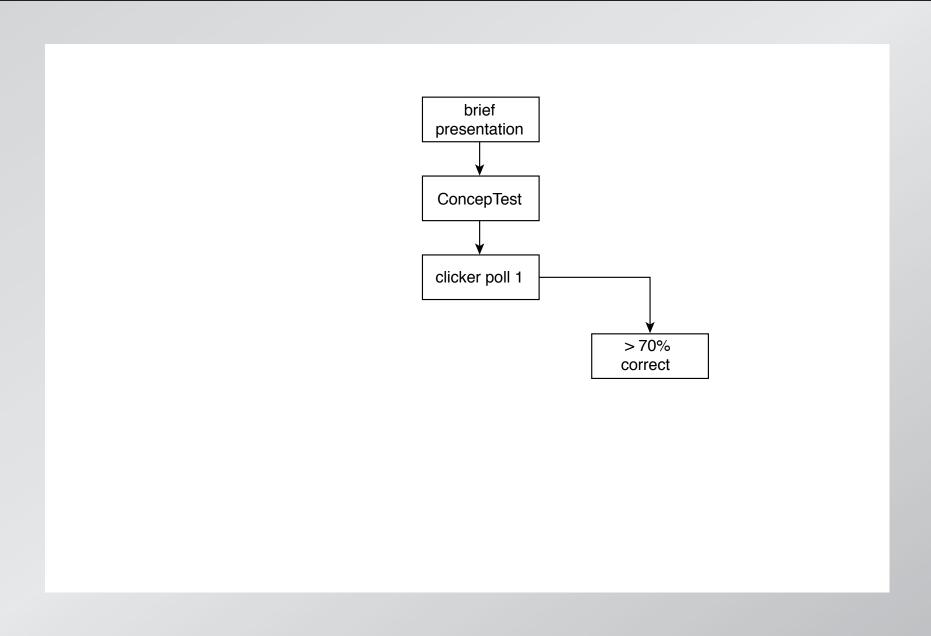

ConcepTests

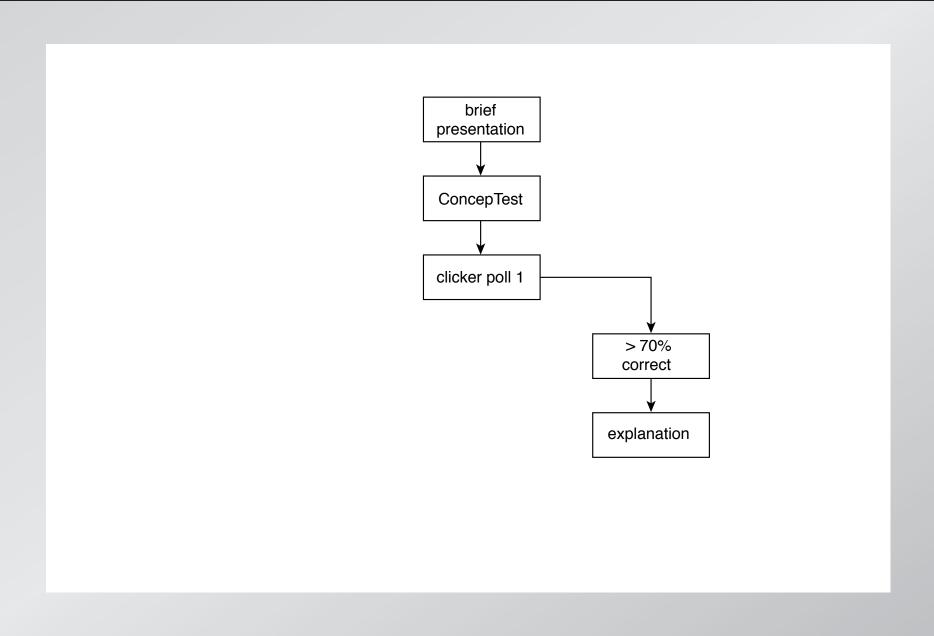

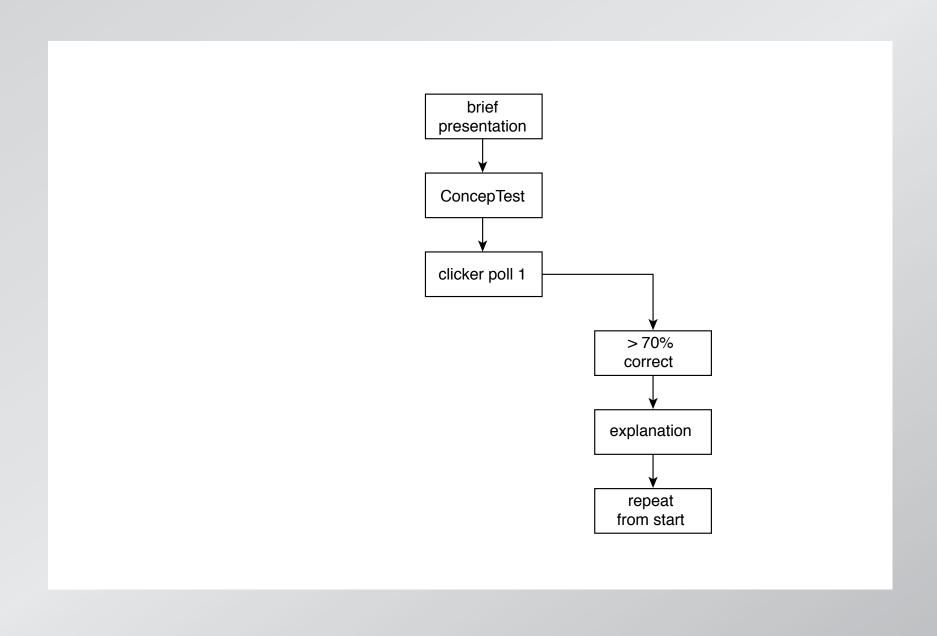

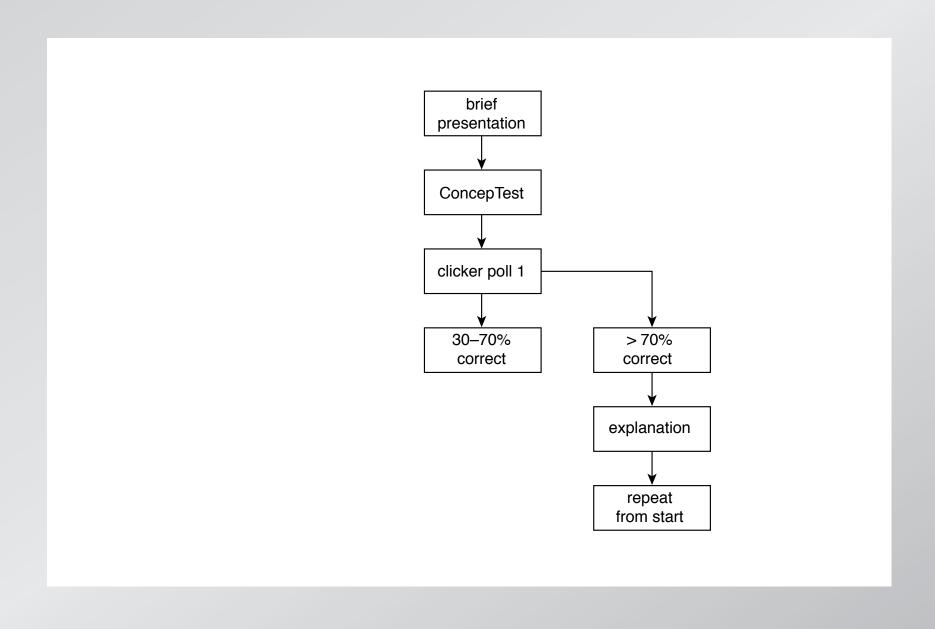

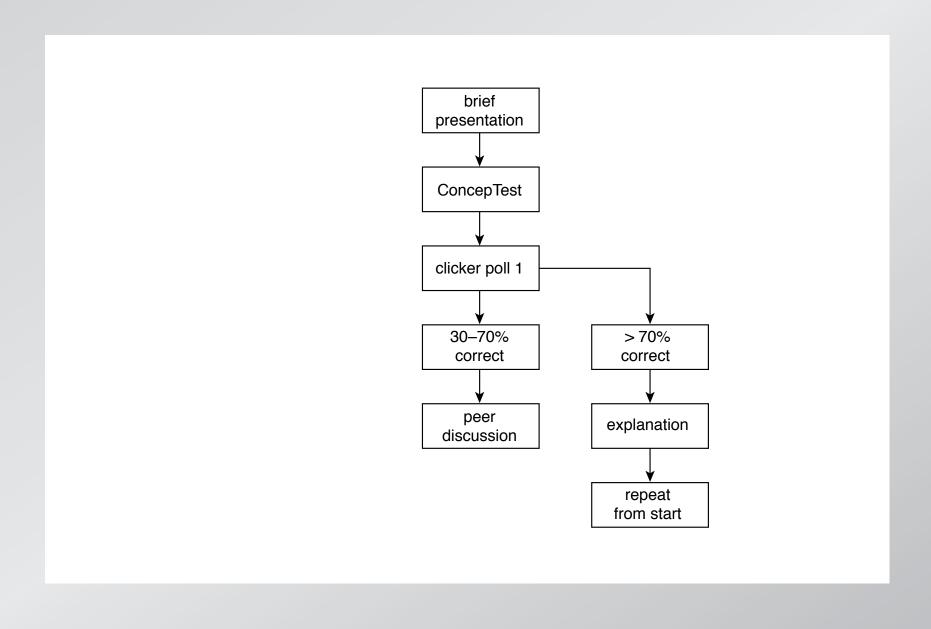

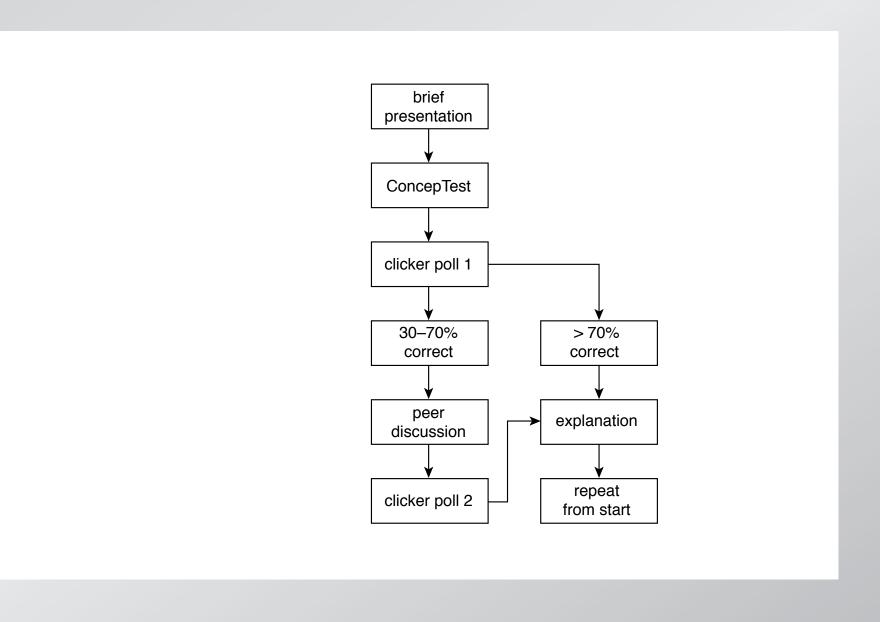

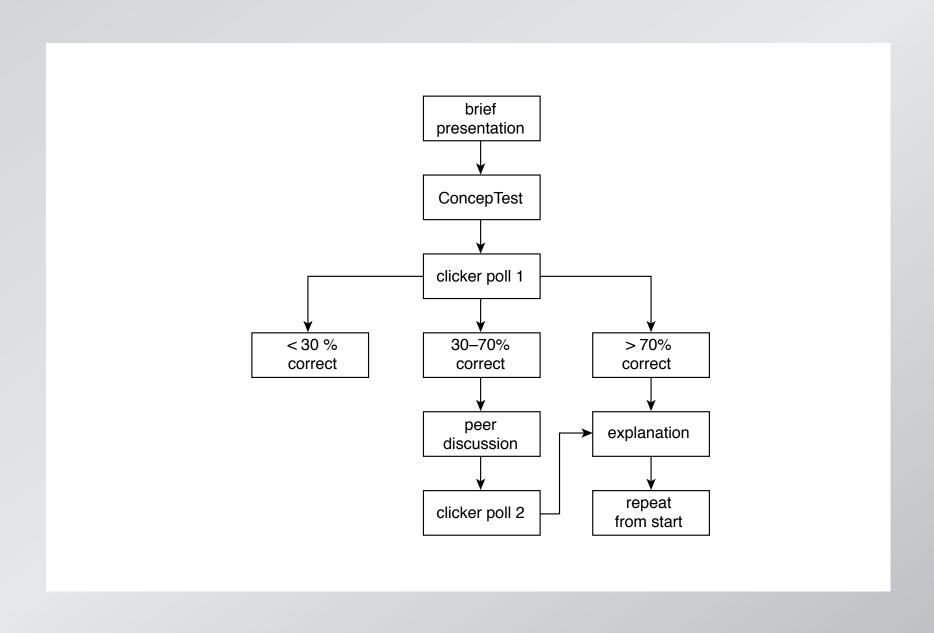

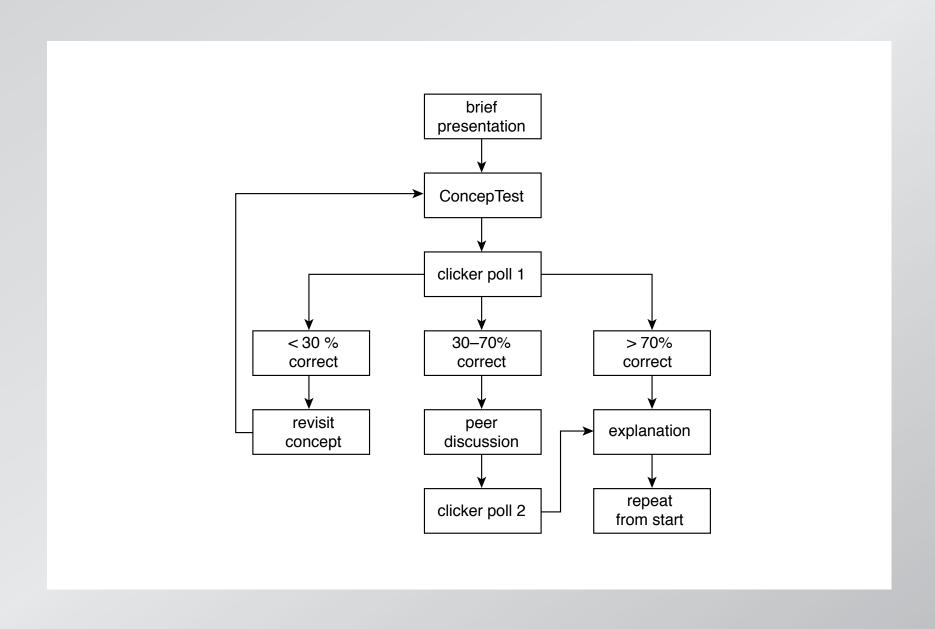

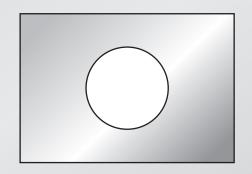

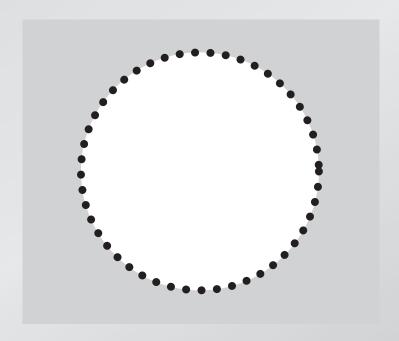

Consider a rectangular metal plate with a circular hole in it.

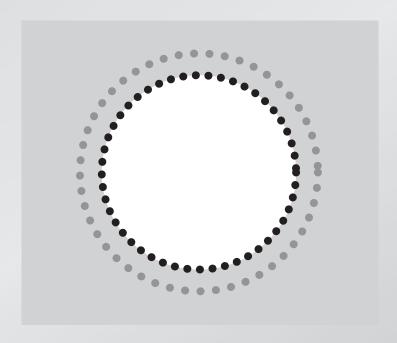

When the plate is uniformly heated, the diameter of the hole

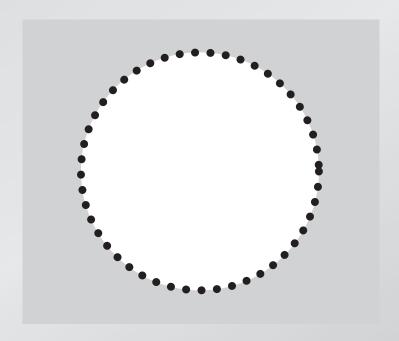

- 1. increases.
- 2. stays the same.
- 3. decreases.

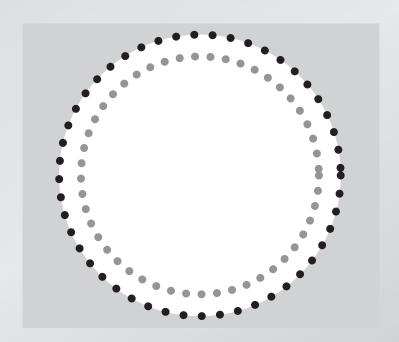

It's easy to fire up the audience!

Professors A and B teach the same mechanics class at the same college during different semesters. Professor A uses the traditional approach to teaching and lectures. Professor B uses Peer Instruction and students respond to the questions using clickers. Each class is evaluated using the traditional end-of-semester questionnaire and using the FCI to measure students' comprehension of mechanics. Both professors are middle-aged and male. The results are as follows.

A: student evaluation: 1.5/5.0; $\langle g \rangle = 0.42$

B: student evaluation: 3.7/5.0; $\langle g \rangle = 0.57$

Professor	Α	В
pedagogy	traditional	PI with clickers
student evaluation	1.5/5.0	3.7/5.0
FCI <g></g>	0.42	0.57

What might account for the large difference in evaluation?

- I. professor personality
- II. technology
- III. pedagogy
- 1. I only
- 2. II only
- 3. III only

- 4. II and III
- 5. I, II, and III
- 6. other combination

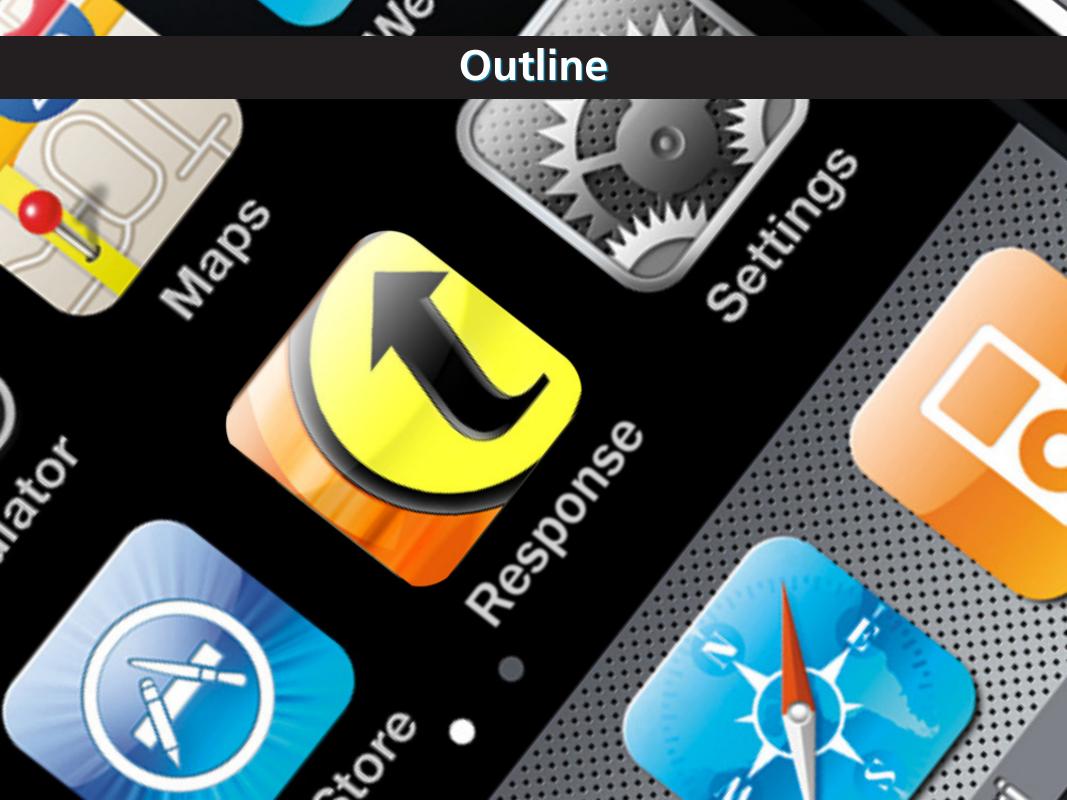

a couple of points worth noting:

1. you got engaged

- 1. you got engaged
- 2. no "correct" answer

- 1. you got engaged
- 2. no "correct" answer
- 3. you got engaged

- 1. you got engaged
- 2. no "correct" answer
- 3. you got engaged
- 4. you don't need a correct answer!

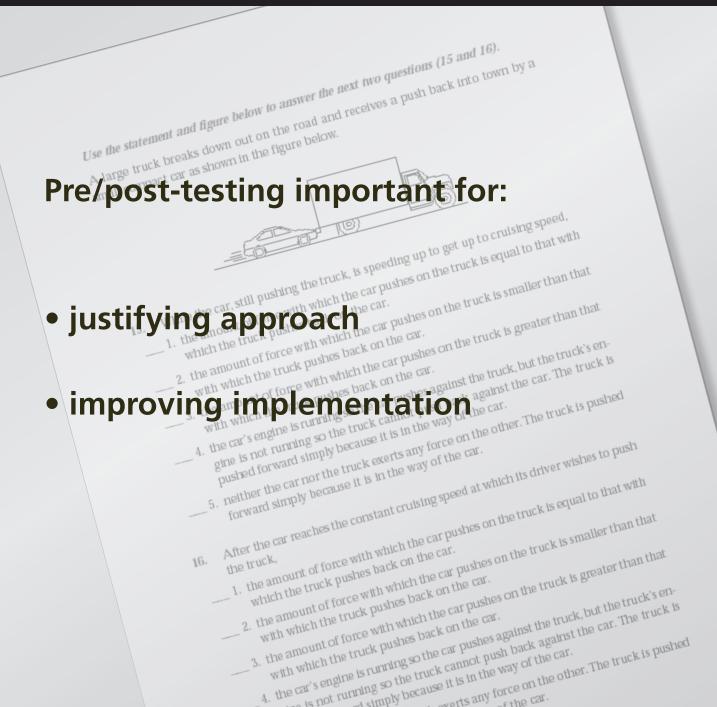

Outline Setting the stage Making it happen Overcoming barriers

To set stage for successful implementation, I need to...

To set stage for successful implementation, I need to...

(actions to take before course begins)

- convince yourself (and your colleagues)
- set learning goals
- select approaches
- identify resources

Evaluate assessment by comparing student performance on various kinds of problems

What constitutes a good problem?

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces.

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces.

How long do you have to wait before someone frees up a space?

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces.

How long do you have to wait before someone frees up a space?

Requires:

Assumptions
Developing a model
Applying that model

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces. On average people shop for 2 hours.

How long do you have to wait before someone frees up a space?

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces. On average people shop for 2 hours.

How long do you have to wait before someone frees up a space?

Requires:

Developing a model Applying that model

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces. On average people shop for 2 hours.

Assuming people leave at regularly-spaced intervals, how long do you have to wait before someone frees up a space?

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces. On average people shop for 2 hours.

Assuming people leave at regularly-spaced intervals, how long do you have to wait before someone frees up a space?

Requires:

Applying a (new) model

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area, where people are known to shop, on average, for 2 hours. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces.

How long do you have to wait before someone frees up a space?

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area, where people are known to shop, on average, for 2 hours. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces.

How long do you have to wait before someone frees up a space?

$$t_{wait} = \frac{T_{shop}}{N_{spaces}}$$

On a Saturday afternoon, you pull into a parking lot with unmetered spaces near a shopping area, where people are known to shop, on average, for 2 hours. You circle around, but there are no empty spots. You decide to wait at one end of the lot, where you can see (and command) about 20 spaces.

How long do you have to wait before someone frees up a space?

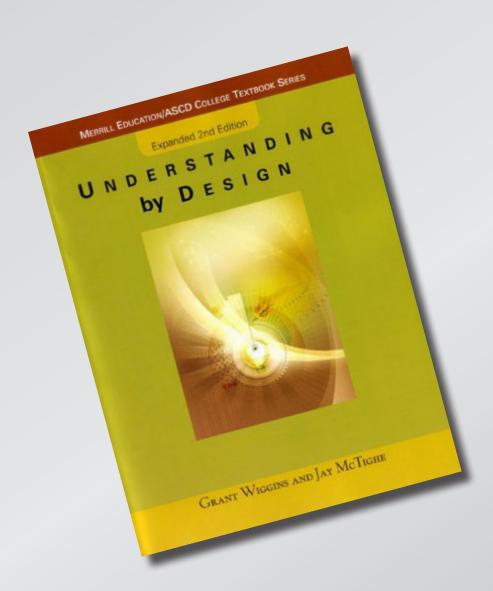

Requires:

Using a calculator

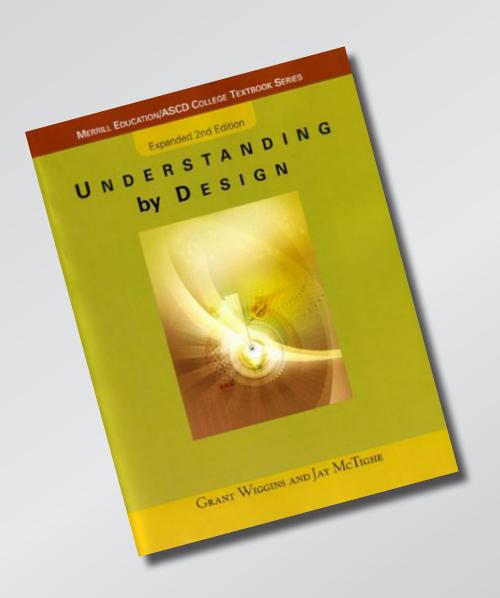

$$t_{wait} = \frac{T_{shop}}{N_{spaces}}$$

Need to test meaningful skills!

Setting learning goals

Setting learning goals

How to move information transfer out of classroom?

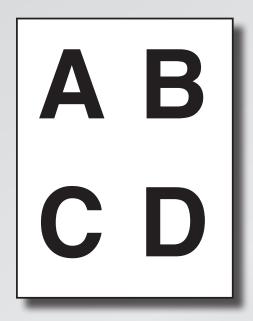

Approaches for reading:

- Reading quizzes
- Summaries
- Just-in-time-Teaching (www.jitt.org)

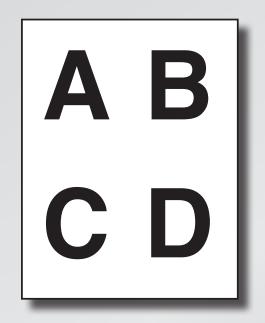

Are clickers a required resource?

Flashcards: simple and effective

Flashcards: simple and effective

Meltzer and Mannivanan, South Eastern Louisiana University

Imagine a rope that fits snugly along the equator.

Imagine a rope that fits snugly along the equator.

Suppose the rope is cut and 1 m of rope is inserted between the cut ends. If the rope were to maintain a circular shape, how far off the surface of the Earth would it float?

- 1. the width of a few atoms
- 2. the width of a few hairs
- 3. the height of a curb
- 4. exactly 1 m
- 5. more than 1 m

circumference at equator:

$$2\pi R_{\rm E}$$

circumference at equator:

$$2\pi R_{\rm E}$$

new circumference:

$$2\pi R_{\rm E} + 1 \,\mathrm{m}$$

circumference at equator:

$$2\pi R_{\rm E}$$

new circumference:

$$2\pi R_{\rm E} + 1 \,\mathrm{m}$$

radius of circle with new circumference:

$$2\pi R = 2\pi R_{\rm E} + 1 \, \text{m}$$
, and so $R = R_{\rm E} + \frac{1 \, \text{m}}{2\pi}$.

You all got fired up!

You all got fired up!

(WITHOUT CLICKERS!)

It's not the technology, but the pedagogy!

It's not the technology, but the pedagogy!

(but clickers do offer advantages)

Types of questions

- survey
- discussion
- model testing
- select from list

Which of the following airlines tries to save fuel by suggesting that its passengers use the bathroom before boarding?

- 1. Delta Airlines
- 2. Lufthansa
- 3. All Nippon Airways
- 4. British Midland Airways
- 5. Air France
- 6. JAL
- 7. Aboriginal Air Services
- 8. Aeroflot
- 9. Are you kidding me? None of the above.

Good conceptual questions (ConcepTests):

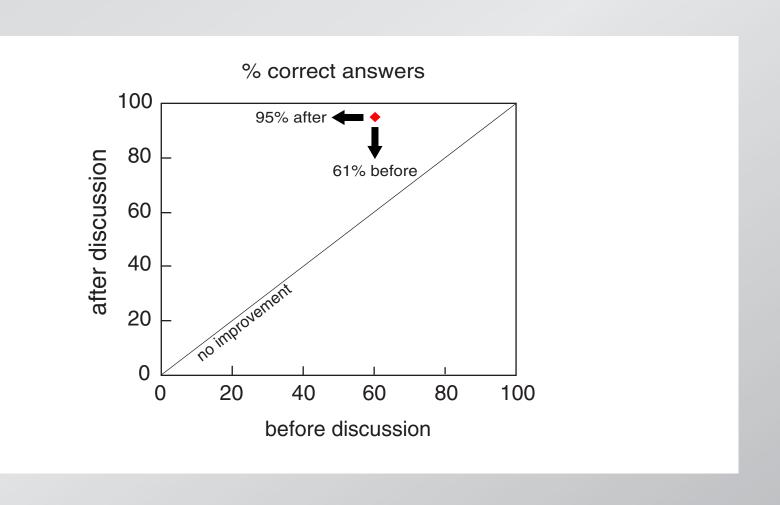

- are based on common student difficulties
- focus on single concept
- require more than "plug and chug"
- are clear and concise
- are of manageable difficulty

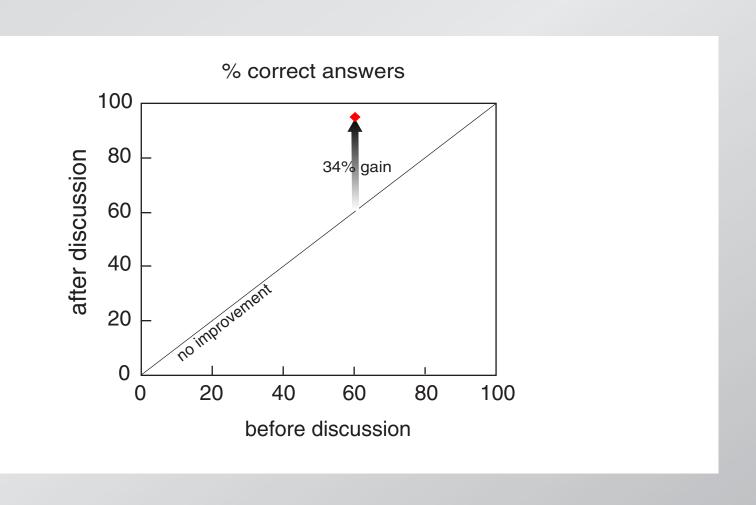

must adjust level to audience

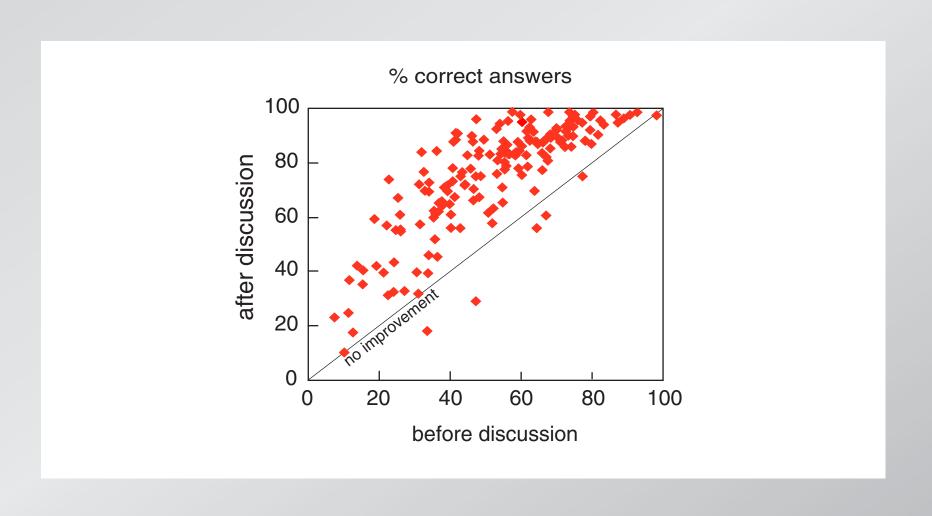

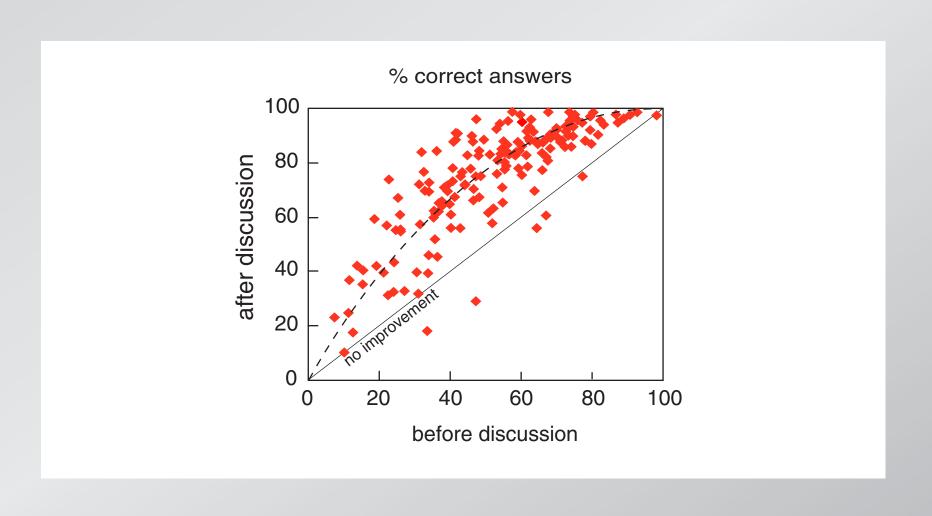

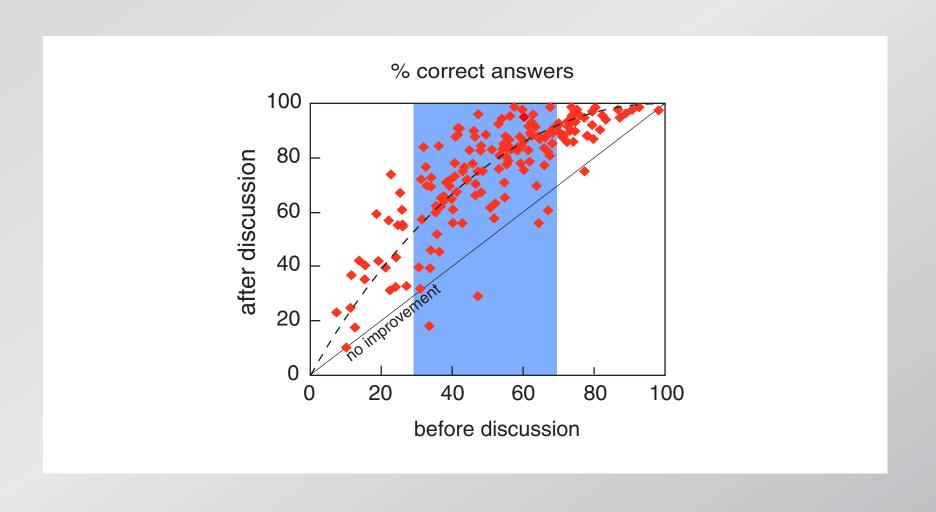

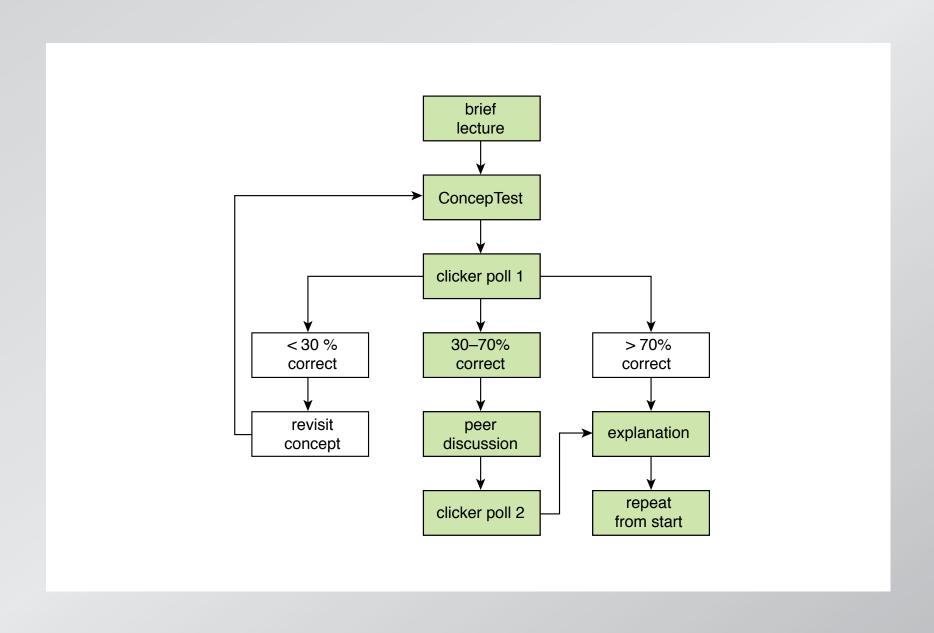

Peer Instruction: a primer

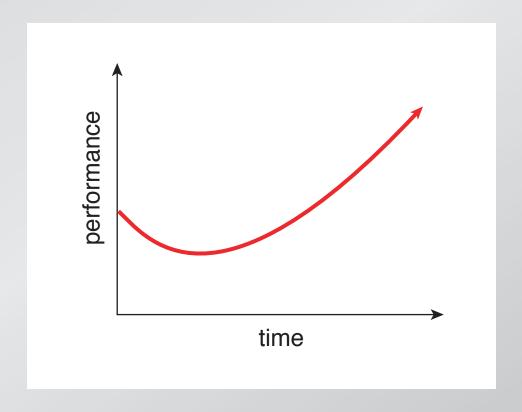

Outline Setting the stage Making it happen Overcoming barriers

What are some potential barriers?

- skepticism
- growing pains
- negative feedback
- limited circle of influence

After changing, things might get worse before they get better!

Better understanding leads to more — not fewer — questions!

(must recognize confusion as step towards understanding)

Things to do:

- take/analyze data
- motivate students
- be prepared for initial adjustments

Why is change so hard?

	"lectures"	PI
coverage	complete	partial
preclass reading	none	cover everything
confusion	little none	substantial
evaluations	known	unknown

	"lectures"	PI	considered
coverage	complete	partial	requirement

evaluations	known	unknown	important

	"lectures"	PI	considered
coverage	complete	partial	requirement
preclass reading	none	cover everything	hurdle
confusion	little none	substantial	problem
evaluations	known	unknown	important

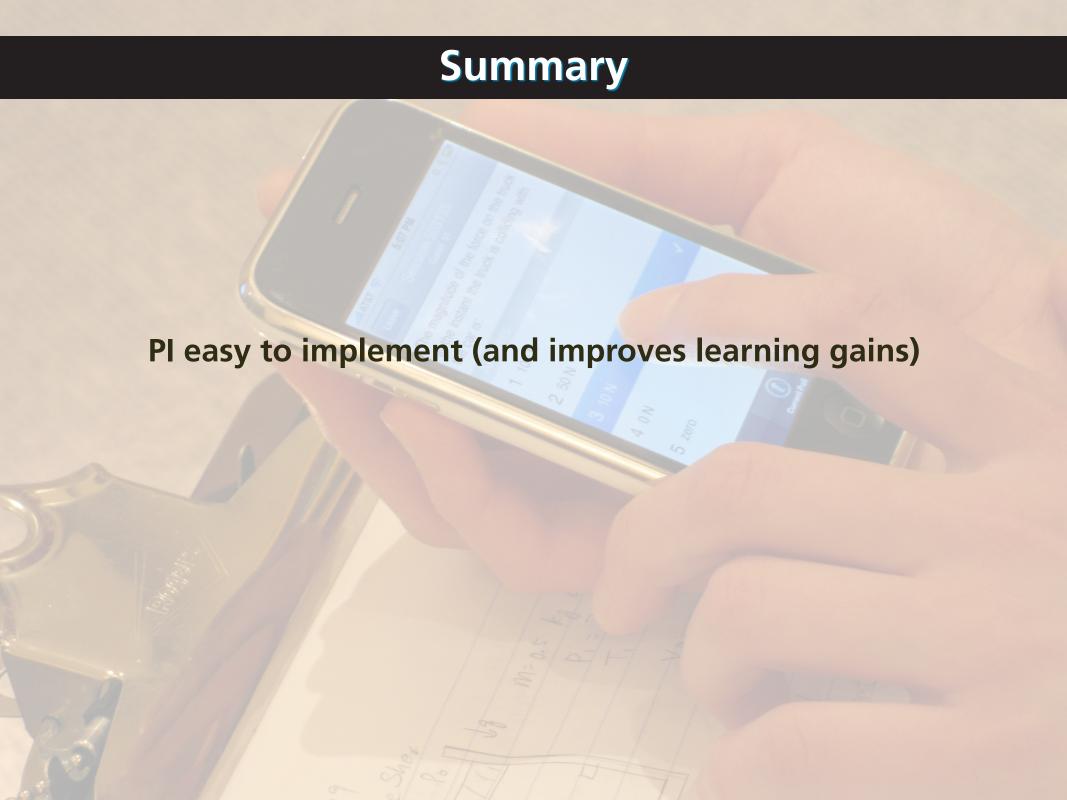

But PI leads to better learning and retention

But PI leads to better learning and retention

(neither of which is traditionally measured)

Summary

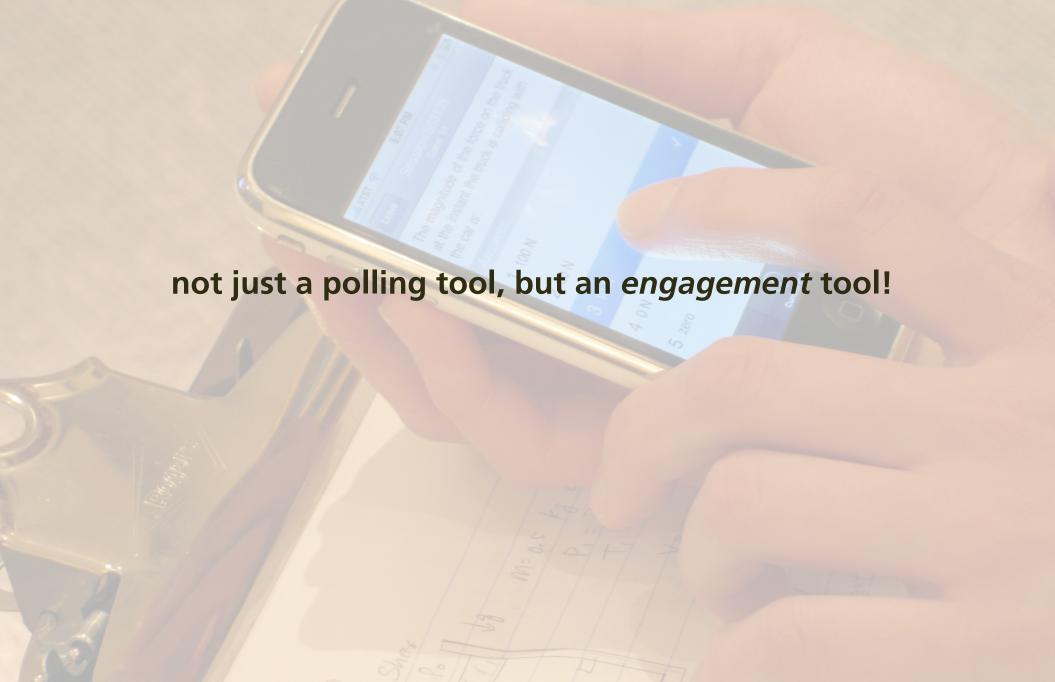

Conclusion

PI easy to implement (and improves learning gains)

technology facilitates active engagement (but not required)

Conclusion

A boat carrying a large boulder is floating on a small pond. The boulder is thrown overboard and sinks to the bottom of the pond.

A boat carrying a large boulder is floating on a small pond. The boulder is thrown overboard and sinks to the bottom of the pond.

After the boulder sinks to the bottom of the pond, the level of the water in the pond is

- 1. higher than
- 2. the same as
- 3. lower than

it was when the boulder was in the boat.

We all make mistakes!

When we hold a page of printed text in front of a mirror, the text on the image in the mirror runs from right to left:

The New York Times

When we hold a page of printed text in front of a mirror, the text on the image in the mirror runs from right to left:

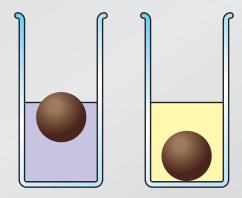

The New York Times

Why is it that right and left are interchanged and not top and bottom? Because:

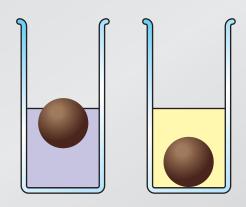

- 1. the mirror is oriented vertically.
- 2. we have two eyes in the horizontal plane.
- 3. the Earth's gravitation is directed downward.
- 4. a habit we have when looking at images in a mirror.
- 5. It only appears to run from left to right.

It's "simple" only if you know the answer

Consider an object that floats in water, but sinks in oil. When the object floats in water, most of it is submerged.

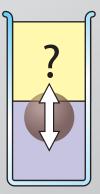

Consider an object that floats in water, but sinks in oil. When the object floats in water, most of it is submerged.

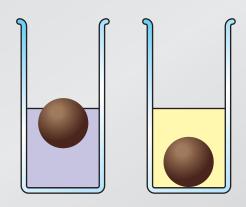

If we slowly pour the oil on top of the water so it completely covers the object, the object

- 1. moves up.
- 2. stays in the same place.
- 3. moves down.

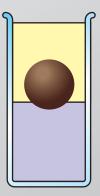

Consider an object that floats in water, but sinks in oil. When the object floats in water, most of it is submerged.

If we slowly pour the oil on top of the water so it completely covers the object, the object

- 1. moves up.
- 2. stays in the same place.
- 3. moves down.

It's easy to make simple demonstrations fascinating!

The specific heat at constant volume for a monatomic crystal approaches zero at low temperature even though the specific heat for a monatomic gas remains $\frac{3}{2}k$ per atom. Why is this so?

The specific heat at constant volume for a monatomic crystal approaches zero at low temperature even though the specific heat for a monatomic gas remains $\frac{3}{2}k$ per atom. Why is this so?

- 1. Potential energy doesn't play a role for the monatomic gas, but it does for the crystal.
- 2. The particles are indistinguishable in the gas, but not in the crystal.
- 3. The energy difference between allowed states for the crystal is much larger than it is for the atoms.
